

Experiment No. 1

Study and Comparison of Low-Code Development and Conventional Software Development

Aim

To understand and compare low-code development with conventional software development.

Conventional Software Development

Conventional development involves writing code using programming languages and follows the SDLC: planning, design, coding, testing, deployment and maintenance.

Advantages:

- Full control
- High scalability
- Better customization

Limitations:

- More time
- Higher cost
- Requires skilled programmers

Low-Code Development

Low-code development uses visual tools and pre-built components to create applications with minimal coding.

Advantages:

- Faster development
- Lower cost
- Easy maintenance

Limitations:

- Limited customization
- Platform dependency

Comparison

Factor	Conventional	Low-Code
Coding	Manual	Minimal

Time	Long	Short
Cost	High	Low
Deployment	Slow	Fast
Best For	Complex systems	Business apps

Result

Low-code development is suitable for rapid application development, while conventional development is better for highly customized and complex software.
